

WE ARE IN CLIMATE CHANGE IN SOUTHWEST FLORIDA

James W. Beever III

WE ARE IN CLIMATE CHANGE IN SOUTHWEST FLORIDA. CLIMATE CHANGE IS CURRENTLY OCCURRING AND MORE CHANGE IS TO BE EXPECTED.

The question for Southwest Floridians is not *whether* they will be affected by climate change, but *how much* they will be affected and in what ways including the *degree* to which it will continue, *how rapidly* change will occur, *what type* of climate changes will occur, and what the *long-term effects* of these changes will be.

IN THE LAST 100 YEARS, SOUTHWEST FLORIDA HAS:

- ☞ Increased annual # days >90° F by 12.
- ☞ No change in total rainfall.
- ☞ Increased rain in rainy season by 6%.
- ☞ Increased sea level by 8-9 inches.
- ☞ We have already experienced:
 - ☞ Increased average air temp change Fort Myers 1.2°F.
 - ... More severe storms
 - ... Loss of mature mangrove, salt marsh, water quality, island area
 - ... Longer, more severe dry seasons
 - ... Shorter wet seasons of higher precipitation

Even the least impact future climate change scenario:

- increased climate instability
- wetter wet seasons
- drier dry seasons
- more extreme hot and cold events
- increased coastal erosion
- continuous (perhaps accelerated) sea-level rise
- shifts in fauna and flora
- increased tropical diseases in plants, wildlife & humans
- destabilized aquatic food webs including increased Harmful Algae Blooms
- increasing strains upon and costs in infrastructure
- increased uncertainty concerning variable risk assessment with uncertain actuarial futures.

CHNEP VULNERABILITY ASSESSMENT (2010)

Charlotte Harbor Regional Climate Change Vulnerability Assessment

The Charlotte Harbor National Estuary Program (CHNEP) is a partnership of citizens, scientists, elected officials, resource managers and commercial and recreational resource users who are working to improve the water quality and ecological integrity of the CHNEP study area. A cooperative decision-making process is used within the program to address diverse resource management concerns in the 4,700-square-mile CHNEP study area.

February 19, 2010

Potential Impacts of Climate Change

Infrastructure

Water
Transportation
Energy Supply & Use

Health

Weather-related Mortality
Infectious Diseases
Air Quality -Respiratory Illnesses

Agriculture

Crop yields
Irrigation demands

Forest

Change in forest composition
Shift geographic range of forests
Forest Health and Productivity

Water Resources

Changes in water supply
Water quality
Increased competition for water

Coastal Areas

Erosion of beaches
Inundate coastal lands
Costs to defend coastal communities

Wildlife and Ecosystems

Shift in ecological zones
Loss of habitat and species
Damage to Habitats

Changes in the Climate

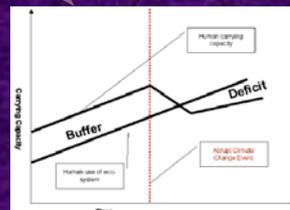

Temperature

Climate Instability

Sea Level Rise

Cultural Resources

Economic Disruption

84 Climate Effects on Natural and Man-Made Systems of Southwest Florida Identified So Far

Tracks of All Recorded Hurricanes for Florida and Eastern Gulf of Mexico

DATABASE OF EXISTING AND POTENTIAL CLIMATE CHANGE EFFECTS

| Climate Effects | |
|---|---|
| Climate Effect Sea level rise resulting from increased temperature and expansion of water volume | Resources Affected Coastal Shorelines: Beaches, Mangroves, Low Marsh River and Creek Shorelines: Beaches, Mangrove, Low Marsh, Bare Shorelines |
| Description of the geographic area affected All coasts not behind a control structure exceed sea-level rise increase. | Estimated number of acres affected 0 |
| ID | 2 |
| Hydrologic Effects? <input checked="" type="checkbox"/> | Description of Hydrologic Effects Higher tides including higher high tides, higher normal tides, and higher low tides |
| Water Quality Effects? <input checked="" type="checkbox"/> | Description of Water Quality Effects Areas that were above wave action zone will become unstabilized. Depending on content of shoreline increased turbidity from destabilized soil particles with increase turbidity, total suspended solids, and nutrient levels |
| Habitat Effects? <input checked="" type="checkbox"/> | Description of Habitat Effects Mangroves and Spartina will be unable to establish in water deeper than the ordinary high tide line so an apparent retreat of the waterward edge of the mangrove fringe with occur; coastal forest loss, die off of Sabal palmetto and other shoreline species |
| Potential Adaptations to the Climate Change Effect local master plans should explicitly indicate which areas will retain natural shorelines | |
| Potential Adaptations to the Climate Change Effect 2 reduce C emission | |
| Record: 1 of 71 | |

Climate Change Drivers and Stressors

Charlotte Harbor Region

Drivers- Drivers include air temperature, air chemistry, water temperature and water chemistry. Air temperature  increases as CO₂  and other greenhouse gases are emitted, fuel is burned , deforestation occurs , normal global warming trends, and other factors. As air temperature increases, so does water temperature . As atmospheric CO₂ levels increase, ocean acidity  also increases. Reduced dissolved oxygen  and increased chlorophyll a  in freshwater lakes and streams is also possible.

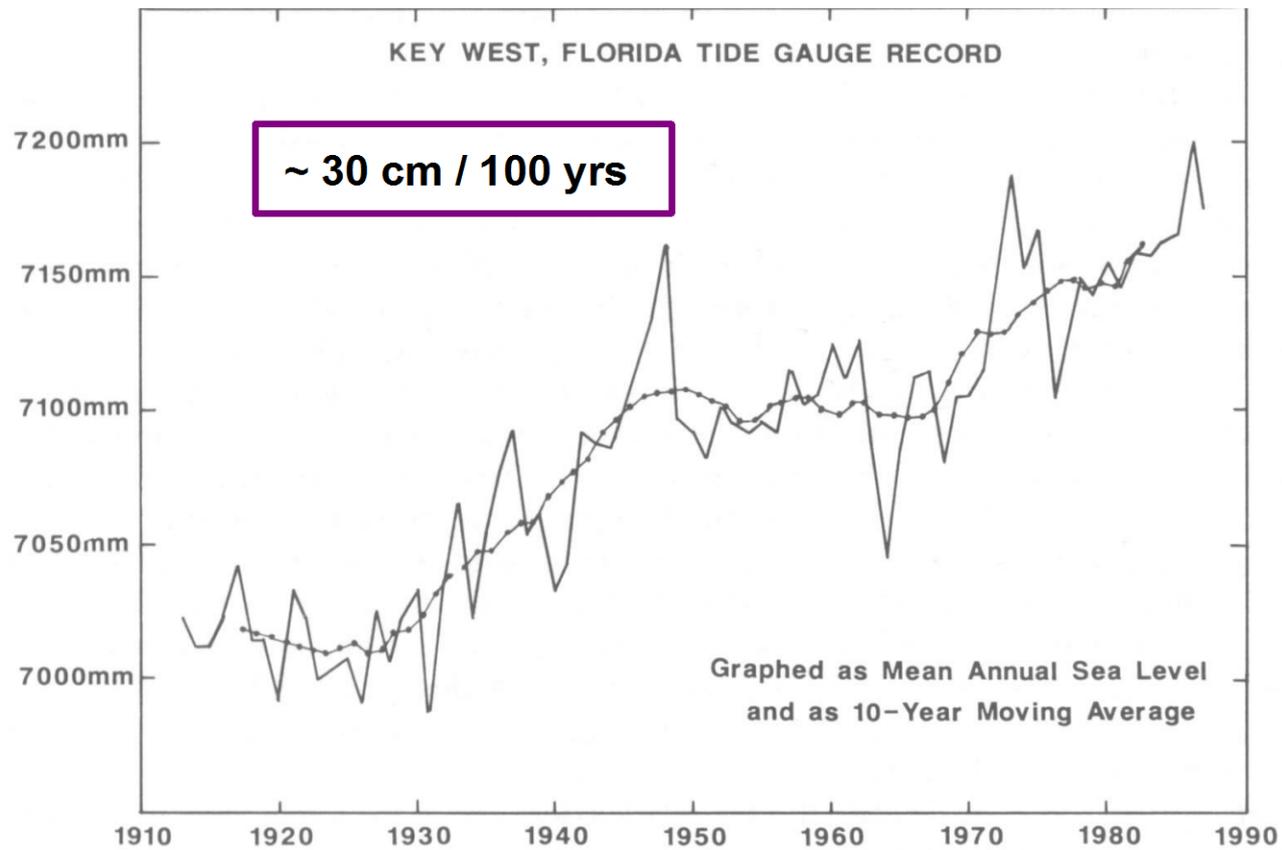

Stressors- With the drivers of air and water temperature and chemistry, stressors on natural and human systems occurs. The climate becomes unstable with resulting changes in precipitation  and increased storm frequency . Changes in rainfall patterns, results in altered hydrology  (changes in stream flow) and increase chances of salt water intrusion . Water temperature and other changes increase sea level .

The climate of southwest Florida is changing now, and has been changing for millennia.

City of Punta Gorda, Florida

Population: 16,600

Area: 14 square miles

Elevation: 0-15 ft.

Already included climate change planning language in comprehensive plan

A CITIZEN-DRIVEN PROCESS

Participants filled out a survey providing demographics and previous experience with Hurricane Charley.

Then, they wrote down the vulnerabilities they thought most important and played a “trading card” game, collaborating to group them into envelopes.

Public participation was key to the project.

Participants then voted to prioritize the grouped vulnerabilities.

Punta Gorda's Grouped Vulnerabilities/ Areas For Adaptation

Fish and Wildlife Habitat Degradation

Inadequate Water Supply

Flooding

Unchecked or Unmanaged Growth

Water Quality Degradation

Education and Economy

and Lack of Funds

Fire

Availability of Insurance

Second Public Meeting

Participants labeled areas on maps where vulnerabilities and/or areas for adaptations existed.

The labels named specific adaptations from citizen suggestions and from the literature.

Adaptations that were NOT desired were also included.

Prioritized List of Adaptations

| Vulnerability | First Adaptation |
|--|--|
| Fish and Wildlife Habitat Degradation | Seagrass protection and restoration |
| Inadequate Water Supply | Xeriscaping and native plant landscaping |
| Flooding | Explicitly indicating in the comp plan which areas will retain natural shorelines |
| Unchecked or Unmanaged Growth | Constraining locations for certain high risk infrastructure |
| Water Quality Degradation | Restrict fertilizer use |
| Education and Economy and Lack of Funds | Promote green building alternatives through education, taxing incentives, green lending |
| Fire | Drought preparedness planning |
| Availability of Insurance | (Implementation of other adaptations will reduce this vulnerability) |

Implementation in Punta Gorda - From Concept to Concrete

Acceptance by City
Council

New riverfront built
with resilient design

Public Works facility
lost in Hurricane
Charley relocated

Model Ordinance
Development with
UF

Comprehensive Plan
language added

New Style

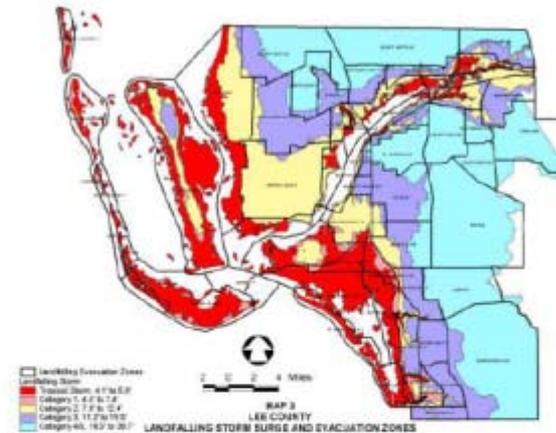

- High ground floor elevation
- Living shoreline with slope
- Substantial vegetative buffer with emergent wetlands and littoral shelf
- Modern stormwater treatment
- Significant fish and wildlife habitat

LEE COUNTY VULNERABILITY ASSESSMENT

- Characterizes current Lee County climate
- Assesses significant potential climate changes and their effects in Lee County
- Suggests methods for prioritizing vulnerabilities

Lee County Climate Change Vulnerability Assessment

Southwest Florida Regional Planning Council

Lee County Roads Vulnerable to Sea Level Rise 2050

Temperature increases could cause changes in ranges for habitats, crop plants, trees, endangered species, exotic species, pests, and disease vectors.

RESILIENCY STRATEGY

Lee County Climate Change Resiliency Strategy (CCRS)

Southwest Florida Regional Planning Council
DRAFT July 30, 2010

Southwest Florida Regional Planning Council

- ❖ Outlines the essential elements of a resiliency strategy
- ❖ Summarizes vulnerabilities
- ❖ Summarizes input received from Lee County leadership and constitutional officers
- ❖ Identifies strategies that Lee County could pursue to increase resiliency to the identified vulnerabilities
- ❖ Identifies ways to incorporate climate change resiliency into the LeePlan
- ❖ Outlines monitoring and evaluation strategies

ONLINE SURVEY

Years in Florida
Years in Lee County
Perceptions of changes in
weather, water quality, fishing
and wildlife

Impacts of Hurricane Charley on
department assets, personnel and
processes

County Commissioners
Division Heads
Constitutional Officers

Age & location of facilities
Potential for facilities to be
storm-hardened
Potential energy-saving
measures for facilities and staff

What is the most important thing
for Lee County to do to prepare
for climate change?
What is the worst thing Lee
County could do to prepare for
climate change?

INTERVIEWS

Reaction to online survey

Reaction to draft

Did we leave out anything important?

Who else should we talk to?

Potential effects of climate change on the department

Lee County's greatest vulnerability to climate change

County Commissioners

Division Heads

Constitutional Officers

How important do you think it is for Lee County to try to deal with climate change in an organized manner?

Avoidance, minimization, mitigation and adaptation ideas

VULNERABILITIES IDENTIFIED BY INTERVIEWEES

Buildings and County Infrastructure

- Impacts to roads from increased creek and stream flows
- More frequent replacement of materials

Coastal Economies

- Declining property values impacting the County's ability to maintain infrastructure and provide adequate services
- Impact on tourism.
- Hotter temperatures will increase the cost of workers' compensation.

Land Use Planning and Growth Management

- Possible reduction of migration into the area and a possible increase in migration out of the area.
- Residents may experience increased response times for emergency services

Economic Development

- Higher utility bills
- More frequent adverse working conditions for outdoor workers

Education and Outreach

- Could impact nearly every area of how the County functions impacting the budget and demanding more interdepartmental and intergovernmental coordination
- Potential for increased variability of weather – more rainfall during and longer periods of drought

Coastal Protections

- Impacts to beaches and the demand for beach renourishment
- More frequent storm events with associated erosion

Health and Human Services

- Increased impact on the economically disadvantaged
- Possible modification of work hours due to hotter temperatures.

Water and Wastewater

- Could experience strains on our freshwater aquifers
- Surface water management issues

Natural Systems and Resources

- Concerns regarding Lake Okeechobee flows
- Could experience impacts to landscaping and plants
- Could impact sea life and the estuary
- Destruction of ecological systems which could severely impact our tourism industry

Building to LEED certification standards.

Converting buses to hybrids.

Identify Lee County's energy goals.

Offsite data storage and protection.

RESILIENCY STRATEGIES

Build or modify structures where they can function in areas with higher surface waters.

Limit the placement of county facilities and infrastructure in flood prone and storm surge areas. This can be problematic since the facilities and infrastructure should be community-based.

Technology infrastructure reduces the need for driving the fleet of automobiles to property locations for valuations.

Building and development codes should be reviewed in light of vulnerabilities/to address strategies

Land acquisition for carbon sequestration

Native plants and reduced irrigation for County facilities

Conservation 20/20

Widening of Alico Road to accommodate business interested in energy research.

Locating healthcare facilities out of vulnerability zones.

Modify County dress codes

Incentivize development and redevelopment within the urban area. Update Comprehensive Plan to reflect changing conditions.

Observation of Coastal Control Line and not allowing building seaward of the coastal construction control line.

Development of a Solar Strategy for inclusion in the comprehensive plan.

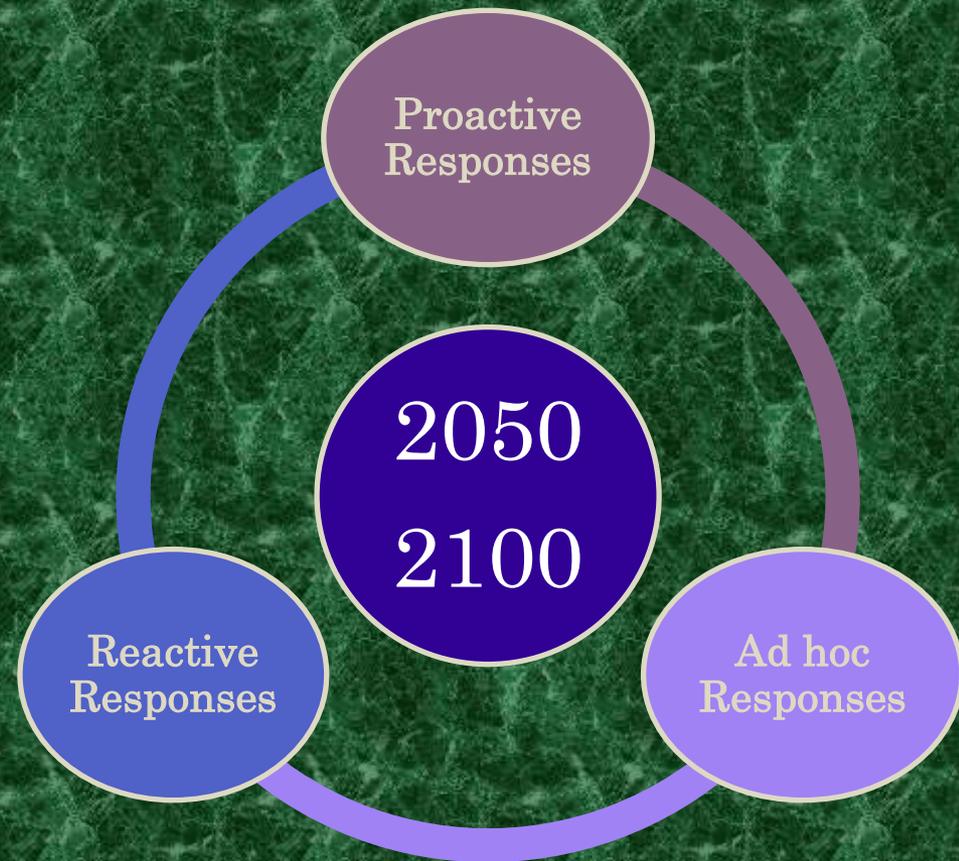

Need more policy analysis regarding land use regulations.

Encourage behavior change in employee trips (carpooling, transit, bicycling, walking, teleworking, four day work weeks, reduction of VMTs, etc)

Reduce automobile dependence.

CONCLUSIONS

- Monitor climate change effects to avoid passing a tipping point
- Consider climate change effects in planning for infrastructure and development
- Continue to set aside natural areas, especially mangroves and salt marsh, as a buffer against climate change effects
- A more detailed communication plan could be developed to take it to the next level

Implementation in Lee County

- ☞ Resiliency strategies incorporated into EAR and Comprehensive Plan revisions
- ☞ Development of LEED certified county facilities
- ☞ Development of biofuels
- ☞ Major energy efficiency effort in county facilities
- ☞ Establishment of an Office of Sustainability

Lee County Public Safety
Building with solar array
